### Hash-Based Indexes

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu\_assist\_pro

#### Introduction

As for any index, 3 alternatives for data entries **k\***:

- Data record with key value k
- 2. < k, rid of data repord with sea rollike y value k>
- 3. < k, list o with search key k > https://eduassistpro.github.io/
- Add WeChat edu\_assist\_pro
  Hash-based indexes ar t for equality
  selections. Cannot support range searches.
- Static and dynamic hashing techniques exist;
   trade-offs similar to ISAM vs. B+ trees.

## Static Hashing

- # primary pages (index data entry pages) fixed, allocated sequentially, never deallocated; overflow pages if needed.
- h(k) mod Mghhucket to which data entry with key k b uckets)

  https://eduassistpro.github.io/

h(key) mod N A dd We Chat edu\_assist\_pro

key

h

N-1

Primary bucket pages

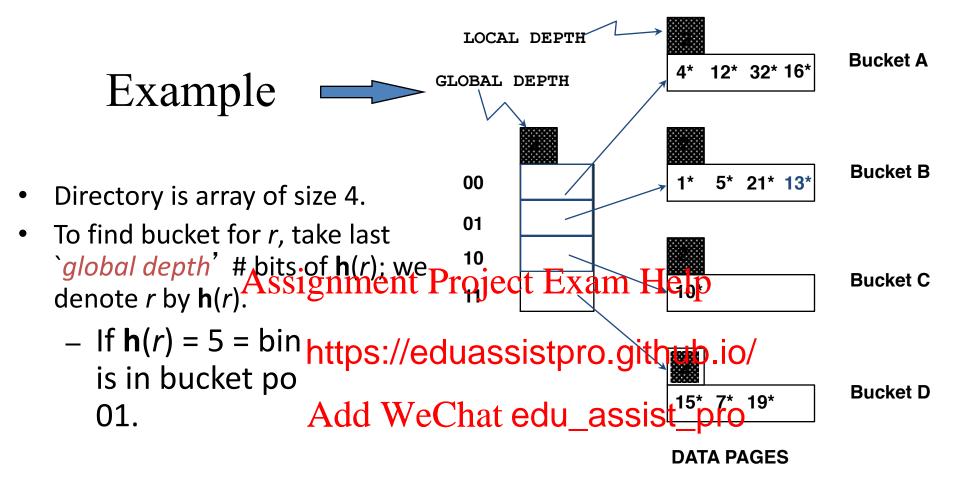

Overflow pages

### Static Hashing (Contd.)

- Buckets contain data entries.
- Hash function works on search key field of record r. Must distribute values over range 0 ...
   M-1.
  - Assignment Project Exam Help
     h(key) = (a \* s well.
  - a and b are https://eduassistpro.github.io/how to tune h.
     Add WeChat edu\_assist\_pro
- Long overflow chains can and degrade performance.
  - Keep 80% full initially and/or re-hashing
  - Extendible and Linear Hashing: Dynamic techniques to fix this problem.

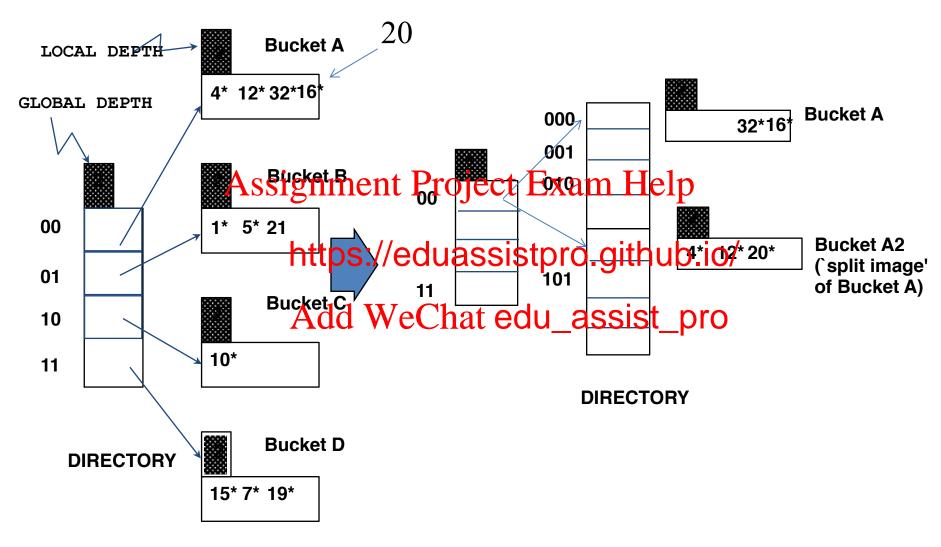

## **Extendible Hashing**

- Situation: Bucket (primary page) becomes full.
   Why not re-organize file by doubling # of buckets?
  - Reading Aarsig wuriting Palbjoag & Sxisnex dehs ive!
  - Idea: Use d https://eduassistpro.github.io/ ry, splitting just the bucket thatdower(lbwt edu\_assist\_pro
  - Directory much smaller than file, so doubling it is much cheaper. Only one page of data entries is split. Ensure no overflow page!
  - Trick lies in how hash function is adjusted!

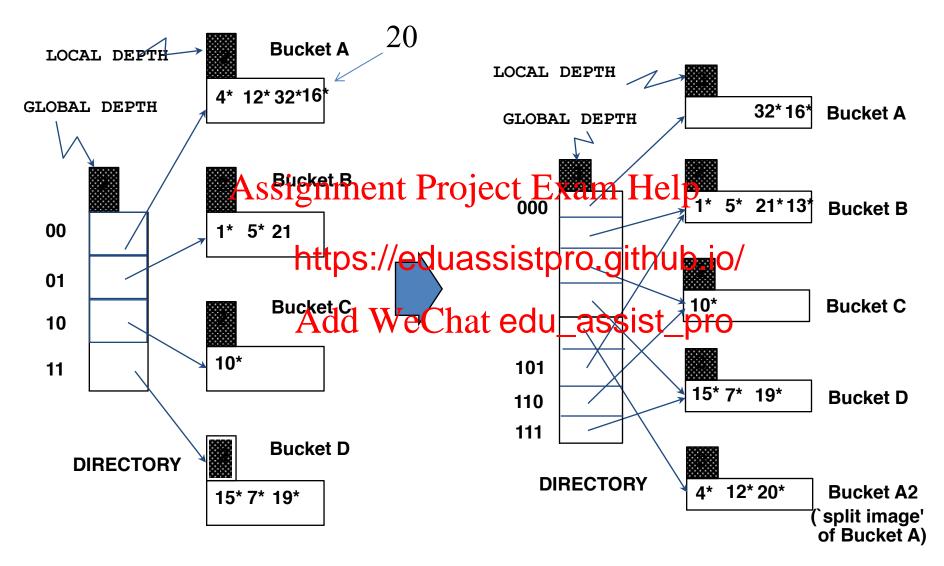

- \* **Insert**: If bucket is full, **split** it (allocate new page, re-distribute).
- \* *If necessary*, double the directory. (As we will see, splitting a bucket does not always require doubling; we can tell by comparing *global depth* with *local depth* for the split bucket.)

# Insert h(r)=20 (Causes Doubling)

# After inserting h(r)=20

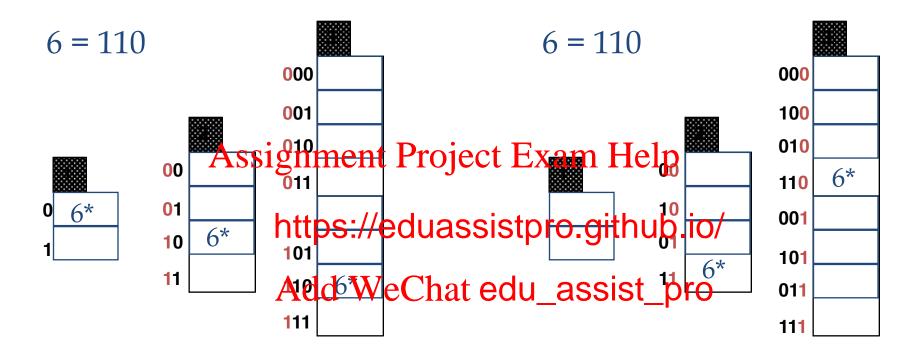

#### Points to Note

- 20 = binary 10100. Last **2** bits (00) cannot tell us *r* belongs in A or A2. Last 3 bits can tell us the which bucket.
  - Global depth of directe Profest Exampits peded to tell which bucket
- Local depth of https://eduassistpro.gitbubeio/mine if an entry belongs to this bucket.

  Add WeChat edu\_assist\_pro

  • When does bucket split cau ry doubling?
- - Before insert, local depth of bucket = global depth. Insert causes *local depth* to become > *global depth*; directory is doubled by copying it over and 'fixing' pointer to split image page. (Use of least significant bits enables efficient doubling via copying of directory!)

## **Directory Doubling**

Least Significant VS. Most Significant

Why use least significant bits in directory?

- Hard to decide where to start
- Quite biased in the most significant bids

## Comments on Extendible Hashing

- If directory fits in memory, equality search answered with one disk access; else two.
  - 100MB file, 100 bytes/rec, 4K pages contains 1,000,000 records (as data entries) and 25,000 directory elements; chances are <a href="https://eduassistpro.github.io/">https://eduassistpro.github.io/</a>
  - Directory gro
     distribution of hash
     values is skeweddwethat edu\_assistgero
  - Multiple entries with same hash value cause problems!
- <u>Delete</u>: If removal of data entry makes bucket empty, can be merged with 'split image'. If each directory element points to same bucket as its split image, can halve directory.

$$2^{N}$$
,  $2^{N+1}$ ,  $2^{N+2}$ ,  $2^{N+4}$ ,  $2^{N+5}$ 

N = 100

## Linear Hashing

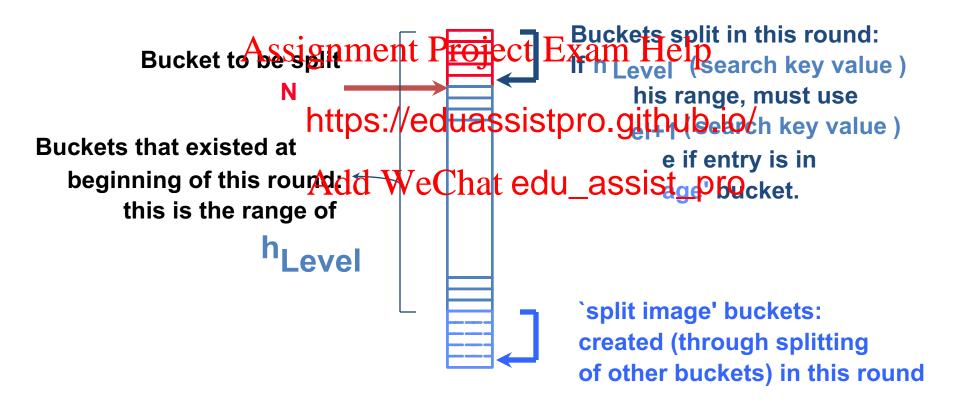

- This is another dynamic hashing scheme, an alternative to Extendible Hashing.
- LH handles the problem of long overflow chains without using is direct bryjean dynamidtes duplicates.
- *Idea*: Use a f https://eduassistpro.gn្កាន្តរៀច/h<sub>1</sub>, h<sub>2</sub>, ...
  - h<sub>i</sub>(key) = h(key) mod(2<sup>i</sup>N); Add WeChat edu\_assist\_pro
  - h is some hash function (ra
     0 to N-1)
  - If N =  $2^{d0}$ , for some d0,  $\mathbf{h}_i$  consists of applying  $\mathbf{h}$  and looking at the last di bits, where di = d0 + i.
  - $\mathbf{h}_{i+1}$  doubles the range of  $\mathbf{h}_i$  (similar to directory doubling)

# Linear Hashing (Contd.)

- Directory avoided in LH by using overflow pages, and choosing bucket to split round-robin.
  - Splitting proceeds in <u>rounds</u>. Round ends when all N<sub>R</sub> initial (for r https://eduassistpro.glthBbckets 0 to Next-1 have bee
  - Current round number is edu\_assist\_pro
  - Search: To find bucket for data entry r, find  $h_{Level}(r)$ :
    - If  $\mathbf{h}_{Level}(r)$  in range `Next to  $N_R$ ', r belongs here.
    - Else, r could belong to bucket  $\mathbf{h}_{Level}(r)$  or bucket  $\mathbf{h}_{Level}(r) + N_R$ ; must apply  $\mathbf{h}_{Level+1}(r)$  to find out.

### Overview of LH File

In the middle of a round.

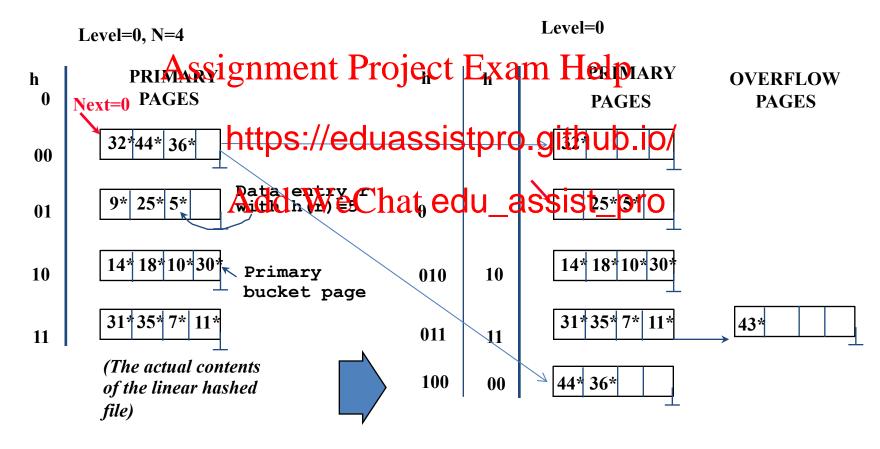

## Linear Hashing (Contd.)

- Insert: Find bucket by applying  $\mathbf{h}_{Level} / \mathbf{h}_{Level+1}$ :
  - If bucket to insert into is full:
    - Add overflow page and insert data entry.
    - (Maybe) Split Mext hucket end incremently
      Next.
- Can choose any crhttps://eduassistpro.github.io/
- Since buckets are salit round not edu\_assistowro chains don't develop!
- Doubling of directory in Extendible Hashing is similar; switching of hash functions is *implicit* in how the # of bits examined is increased.

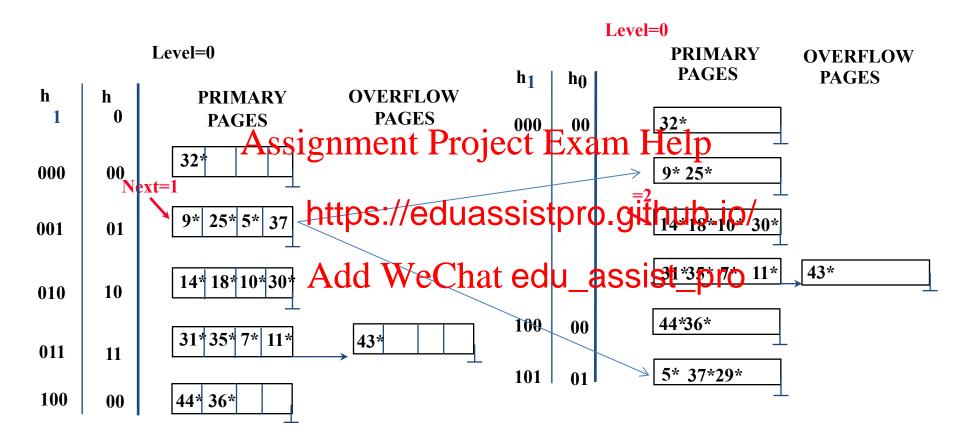

Usually, when a new overflow page is created.

# **Example of Linear Hashing**

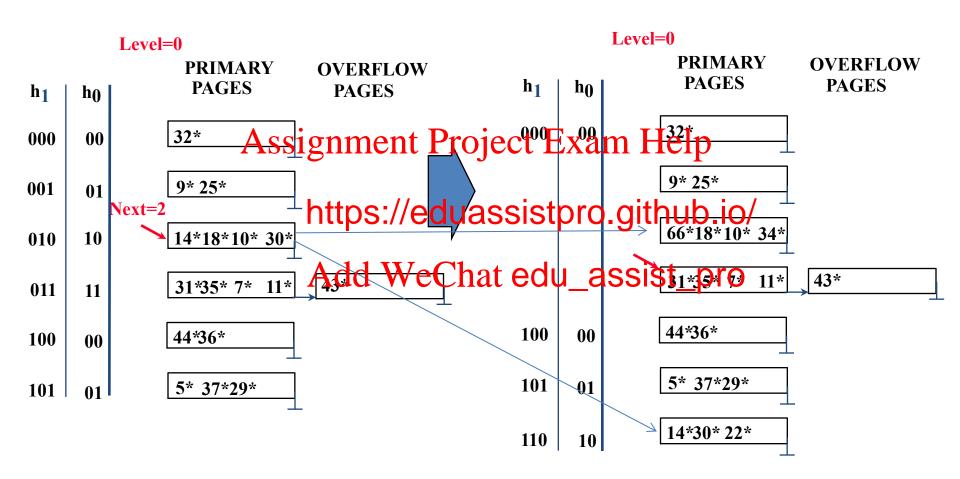

Insert 43\*

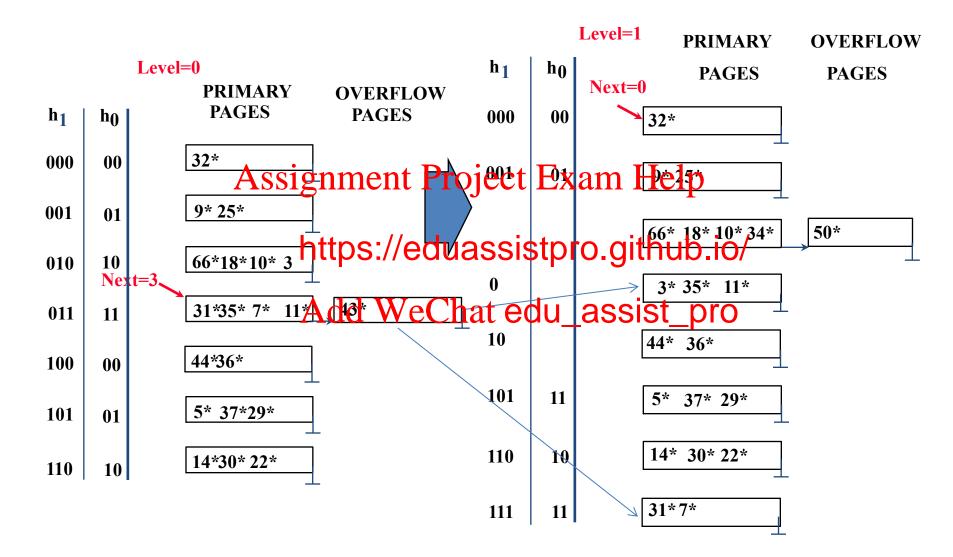

#### Insert 37 29

#### Insert 34 66 22

#### Insert 50

### LH Described as a Variant of EH

- The two schemes are actually quite similar:
  - Begin with an EH index where directory has N elements. Assignment Project Exam Help
  - Use overflow https://eduassistpro.github.io/
  - First split is at irectory being doubled at this point. Chat edu\_assist\_1,NP1>, <2,N+2>, ... are the same. So, need only create directory element N, which differs from 0, now.
    - When bucket 1 splits, create directory element N+1, etc.
- So, directory can double gradually. Also, primary bucket pages are created in order. If they are

## Summary

- Hash-based indexes: best for equality searches, cannot support range searches.
- Static Hashing can lead to long overflow chains.
- Extendible Has w pages by splitting a full https://eduassistpro.gidata.ie/ntry is to be added to it. Approvise that edu\_assist/ippoverflow pages.)
  - Directory to keep track of buckets, doubles periodically.
  - Can get large with skewed data; additional I/O if this does not fit in main memory.

# Summary (Contd.)

- Linear Hashing avoids directory by splitting buckets round-robin, and using overflow pages.
  - Overflow pages not likely to be long.
  - Duplicates handled easily exam Help
  - Space utiliz
     Hashing, sin https://eduassistpro.github.io/ dense data

     Add WeChat edu\_assist\_pro
    - Can tune criterion for triggering splits to trade-off slightly longer chains for better space utilization.
- For hash-based indexes, a skewed data distribution is one in which the hash values of data entries are not uniformly distributed!
